16	C Program to implement the Contiguous Memory Variable Partition technique (MVT).	04 May	42-43	

Operating System Lab Basic Program in C

1. INTRODUCTION OF C PROGRAMMING LANGUAGE

The C language is a structure oriented programming language, developed at Bell Laboratories in 1972 by Dennis Ritchie

C programming language features were derived from an earlier language called “B” (Basic Combined Programming Language – BCPL)

2. FEATURES OF C LANGUAGE:

C language is one of the powerful languages. Below are some of the features of C language.

Reliability

Portability

Flexibility

Interactivity

Modularity

Efficiency and Effectiveness

3. LEVEL IS C LANGUAGE BELONGING TO?

There are 3 levels of programming languages. They are,

A. Middle Level languages:

Middle level languages don’t provide all the built-in functions found in high level languages, but provides all building blocks that we need to produce the result we want. Examples: C, C++

B. High Level languages:

High level languages provide almost everything that the programmer might need to do as already built into the language. Example: Java, Python

C. Low Level languages:

Low level languages provide nothing other than access to the machines basic instruction set. Example: Assembler

4. C LANGUAGE IS A STRUCTURED LANGUAGE:

Structure oriented language:

In this type of language, large programs are divided into small programs called functions

Prime focus is on functions and procedures that operate on the data Data moves freely around the systems from one function to another Program structure follows “Top Down Approach”

Examples: C, Pascal, ALGOL and Modula-2

Object oriented language:

In this type of language, programs are divided into objects

Prime focus is in the data that is being operated and not on the functions or procedures

Data is hidden and cannot be accessed by external functions

Program structure follows “Bottom UP Approach”

Examples: C++, JAVA and C# (C sharp)

Non structure oriented language:

There is no specific structure for programming this language. Examples: BASIC, COBOL, FORTRAN

5. TO WRITE A C PROGRAM:

Below are few commands and syntax used in C programming to write a simple C program. Let’s see all the sections of a simple C program line by line.

C Basic commands Explanation

#include <stdio.h> This is a preprocessor command that includes standard input output header file(stdio.h) from the C library before compiling a C program

int main() This is the main function from where execution of any C program begins.

{ This indicates the beginning of the main function.

/*_some_comments_*/ whatever is given inside the command “/* */” in any C program, won’t be considered for compilation and execution.

printf(“Hello_World! “); printf command prints the output onto the screen.

getch(); This command waits for any character input from keyboard.

return 0; This command terminates C program (main function) and returns 0.

} This indicates the end of the main function.

Program

Program 1:- Print the message Hello world

```
#include <stdio.h>
int main()
{
  /* Our first simple C basic program */
  printf("Hello World! ");
  getch();
  return 0;
}
```

OUTPUT:

```
Hello World!
```

3. STEPS TO WRITE C PROGRAMS AND GET THE OUTPUT:

Below are the steps to be followed for any C program to create and get the output. This is common to all C program and there is no exception whether its a very small C program or very large C program.

1. Create
2. Compile
3. Execute or Run
4. Get the Output

4. CREATION, COMPILATION AND EXECUTION OF A C PROGRAM:

Prerequisite:

- If you want to create, compile and execute C programs by your own, you have to install C compiler in your machine. Then, you can start to execute your own C programs in your machine.
- You can refer below link for how to install C compiler and compile and execute C programs in your machine.
- Once C compiler is installed in your machine, you can create, compile and execute C programs as shown in below link.

Program 2 . C program print integer

This c program first inputs an integer and then prints it. Input is done using scanf function and number is printed on screen using printf.

```
#include <stdio.h>
int main()
{
int a;
printf("Enter an integer\n");
scanf("%d", &a);
printf("Integer that you have entered is %d\n", a);
return 0;
}
```

Program No 3:- Add two numbers

```
#include<stdio.h>
main()
{
int a, b, c;
printf("Enter two numbers to
add\n"); scanf("%d%d",&a,&b);
c = a + b;
printf("Sum of entered numbers = %d\n",c);
return 0;
}
```

Program 4 : c printf() function

```
1  #include <stdio.h>
2  int main()
3  {
4     char ch = 'A';
5     char str[20] = "fresh2refresh.com";
6     float flt = 10.234;
7     int no = 150;
8     double dbl = 20.123456;
9     printf("Character is %c \n", ch);
10    printf("String is %s \n" , str);
11    printf("Float value is %f \n", flt);
12    printf("Integer value is %d\n" , no);
13    printf("Double value is %lf \n", dbl);
14    printf("Octal value is %o \n", no);
15    printf("Hexadecimal value is %x \n", no);
16    return 0;
```

```
17 }
```

OUTPUT:

```
Character is A
String is fresh2refresh.com
Float value is 10.234000
Integer value is 150
Double value is 20.123456
Octal value is 226
Hexadecimal value is 96
```

Program 5: for c arithmetic operators:

```
1  #include <stdio.h>
2
3  int main()
4  {
5     int a=40,b=20, add,sub,mul,div,mod;
6     add = a+b;
7     sub = a-b;
8     mul = a*b;
9     div = a/b;
10    mod = a%b;
11    printf("Addition of a, b is : %d\n", add);
12    printf("Subtraction of a, b is : %d\n", sub);
13    printf("Multiplication of a, b is : %d\n", mul);
14    printf("Division of a, b is : %d\n", div);
15    printf("Modulus of a, b is : %d\n", mod);
16 }
```

OUTPUT:

```
Addition of a, b is : 60
Subtraction of a, b is : 20
Multiplication of a, b is : 800
Division of a, b is : 2
Modulus of a, b is : 0
```

PROGRAM 6 :LOGICAL OPERATORS IN C:

```
1  #include <stdio.h>
2
3  int main()
4  {
5     int m=40,n=20;
6     int o=20,p=30;
7     if (m>n && m !=0)
```

```
 8    {
 9      printf("&& Operator : Both conditions are true\n");
10    }
11    if (o>p || p!=20)
12    {
13      printf("|| Operator : Only one condition is true\n");
14    }
15    if (!(m>n && m !=0))
16    {
17      printf("! Operator : Both conditions are true\n");
18    }
19    else
20    {
21      printf("! Operator : Both conditions are true. " \
22      "But, status is inverted as false\n");
23    }
24 }
```

OUTPUT:

```
&& Operator : Both conditions are true
|| Operator : Only one condition is true
! Operator : Both conditions are true. But, status is inverted as false
```

PROGRAM 7- FOR CONDITIONAL/TERNARY OPERATORS IN C:

```
1 #include <stdio.h>
2
3 int main()
4 {
5    int x=1, y ;
6    y = ( x ==1 ? 2 : 0 ) ;
7    printf("x value is %d\n", x);
8    printf("y value is %d", y);
9 }
```

OUTPUT:

```
x value is 1
y value is 2
```

PROGRAM 8 :- FOR IF STATEMENT IN C:

```
#include <stdio.h>
int main()
{
  int m=40,n=40;
  if (m == n)
  {
```

```
  printf("m and n are equal");
  }
}
```

OUTPUT:

```
m and n are equal
```

PROGRAM 9: FOR IF ELSE STATEMENT IN C:

```
 1  #include <stdio.h>
 2  int main()
 3  {
 4    int m=40,n=20;
 5    if (m == n)
 6    {
 7    printf("m and n are equal");
 8    }
 9    else
10    {
11    printf("m and n are not equal");
12    }
13
14 }
```

OUTPUT:

```
m and n are not equal
```

PROGRAM 10 :- FOR NESTED IF STATEMENT IN C:

```
 1  #include <stdio.h>
 2  int main()
 3  {
 4    int m=40,n=20;
 5    if (m>n) {
 6   printf("m is greater than n");
 7    }
 8    else if(m<n) {
 9    printf("m is less than n");
10    }
11    else {
12    printf("m is equal to n");
13    }
14 }
```

OUTPUT:

```
m is greater than n
```

PROGRAM 11:- (FOR LOOP) IN C:

In for loop control statement, loop is executed until condition becomes false.

```
include <stdio.h>

int main()
{
  int i;

  for(i=0;i<10;i++)
  {
     printf("%d ",i);
  }

}
```

OUTPUT:

```
0 1 2 3 4 5 6 7 8 9
```

PROGRAM 12:- (WHILE LOOP) IN C:

```
1  #include <stdio.h>
2
3  int main()
4  {
5    int i=3;
6
7    while(i<10)
8    {
9      printf("%d\n",i);
10     i++;
11   }
12
13 }
```

OUTPUT:

```
3 4 5 6 7 8 9
```

PROGRAM 13:- (DO WHILE LOOP) IN C:

```
1  #include <stdio.h>
2
3  int main()
4  {
```

```
 5    int i=1;
 6
 7    do
 8    {
 9        printf("Value of i is %d\n",i);
10        i++;
11    }while(i<=4 && i>=2);
12
13 }
```

OUTPUT:

```
Value of i is 1
Value of i is 2
Value of i is 3
Value of i is 4
```

Case control statements

PROGRAM 14 :- FOR SWITCH..CASE STATEMENT IN C:

```
 1  #include <stdio.h>
 2
 3  int main ()
 4  {
 5     int value = 3;
 6     switch(value)
 7     {
 8       case 1:
 9       printf(“Value is 1 \n” );
10       break;
11
12       case 2:
13       printf(“Value is 2 \n” );
14       break;
15
16       case 3:
17       printf(“Value is 3 \n” );
18       break;
19
20       case 4:
21       printf(“Value is 4 \n” );
22       break;
23
24       default :
25       printf(“Value is other than 1,2,3,4 \n” );
26     }
27     return 0;
```

```
28 }
```

OUTPUT:

```
Value is 3
```

PROGRAM 15 :- FOR BREAK STATEMENT IN C:

```
 1  #include <stdio.h>
 2  int main()
 3  {
 4     int i;
 5
 6     for(i=0;i<10;i++)
 7     {
 8       if(i==5)
 9       {
10          printf("\nComing out of for loop when i = 5");
11          break;
12       }
13       printf("%d ",i);
14    }
15 }
```

OUTPUT:

```
0 1 2 3 4
Coming out of for loop when i = 5
```

PROGRAM 16: FOR CONTINUE STATEMENT IN C:

```
 1  #include <stdio.h>
 2  int main()
 3  {
 4     int i;
 5     for(i=0;i<10;i++)
 6     {
 7       if(i==5 || i==6)
 8       {
 9         printf("\nSkipping %d from display using " \
10         "continue statement \n",i);
11         continue;
12       }
13       printf("%d ",i);
14    }
15 }
```

OUTPUT:

```
0 1 2 3 4
Skipping 5 from display using continue statement
Skipping 6 from display using continue statement
7 8 9
```

PROGRAM 17 :- FOR GOTO STATEMENT IN C:

```
1  #include <stdio.h>
2  int main()
3  {
4     int i;
5     for(i=0;i<10;i++)
6       {
7     if(i==5)
8     {
9       printf("\nWe are using goto statement when i = 5");
10      goto HAI;
11    }
12    printf("%d ",i);
13 }
14
15 HAI : printf("\nNow, we are inside label name \"hai\" \n");
16 }
```

OUTPUT:

```
0 1 2 3 4
We are using goto statement when i = 5
Now, we are inside label name “hai”
```

PROGRAM 18 : FOR ONE DIMENSIONAL ARRAY IN C:

```
1  #include<stdio.h>
2
3  int main()
4  {
5      int i;
6      int arr[5] = {10,20,30,40,50};
7
8        // declaring and Initializing array in C
9        //To initialize all array elements to 0, use int arr[5]={0};
10       /* Above array can be initialized as below also
11       arr[0] = 10;
12       arr[1] = 20;
13       arr[2] = 30;
14       arr[3] = 40;
15       arr[4] = 50; */
```

```
16
17      for (i=0;i<5;i++)
18      {
19          // Accessing each variable
20          printf("value of arr[%d] is %d \n", i, arr[i]);
21       }
22
23 }
```

OUTPUT:

```
value of arr[0] is 10
value of arr[1] is 20
value of arr[2] is 30
value of arr[3] is 40
value of arr[4] is 50
```

PROGRAM 19 :- FOR TWO DIMENSIONAL ARRAY IN C:

```
 1  #include<stdio.h>
 2
 3  int main()
 4  {
 5     int i,j;
 6     // declaring and Initializing array
 7     int arr[2][2] = {10,20,30,40};
 8     /* Above array can be initialized as below also
 9        arr[0][0] = 10; // Initializing array
10        arr[0][1] = 20;
11        arr[1][0] = 30;
12        arr[1][1] = 40; */
13     for (i=0;i<2;i++)
14     {
15        for (j=0;j<2;j++)
16        {
17           // Accessing variables
18           printf("value of arr[%d] [%d] : %d\n",i,j,arr[i][j]);
19        }
20     }
21 }
```

OUTPUT:

```
value of arr[0] [0] is 10
value of arr[0] [1] is 20
value of arr[1] [0] is 30
value of arr[1] [1] is 40
```

PROGRAM 20 :- FOR STRING IN C:

```
#include <stdio.h>
#include <string.h>

int main( )
{
  char source[ ] = " fresh2refresh" ;
  char target[ ]= " C tutorial" ;

  printf ( "\nSource string = %s", source ) ;
  printf ( "\nTarget string = %s", target ) ;

  strcat ( target, source ) ;

  printf ( "\nTarget string after strcat( ) = %s", target ) ;
}
```

OUTPUT:

```
Source string                    = fresh2refresh
Target string                    = C tutorial
Target string after strcat( ) = C tutorial fresh2refresh
```

PROGRAM 21:- FOR C FUNCTION:

```
 1  #include<stdio.h>
 2  // function prototype, also called function declaration
 3  float square ( float x );
 4  // main function, program starts from here
 5
 6  int main( )
 7  {
 8     float m, n ;
 9     printf ( "\nEnter some number for finding square \n");
10     scanf ( "%f", &m ) ;
11     // function call
12     n = square ( m ) ;
13     printf ( "\nSquare of the given number %f is %f",m,n );
14  }
15
16  float square ( float x )   // function definition
17  {
18     float p ;
19     p = x * x ;
```

```
20     return ( p ) ;
21 }
```

OUTPUT:

```
Enter some number for finding square
2
Square of the given number 2.000000 is 4.000000
```

PROGRAM 22 :- FOR C FUNCTION (USING CALL BY VALUE):

```
 1  #include<stdio.h>
 2  // function prototype, also called function declaration
 3  void swap(int a, int b);
 4
 5  int main()
 6  {
 7      int m = 22, n = 44;
 8      // calling swap function by value
 9      printf(" values before swap  m = %d \nand n = %d", m, n);
10      swap(m, n);
11 }
12
13 void swap(int a, int b)
14 {
15      int tmp;
16      tmp = a;
17      a = b;
18      b = tmp;
19      printf(" \nvalues after swap m = %d\n and n = %d", a, b);
20 }
```

OUTPUT:

```
values before swap m = 22
and n = 44
values after swap m = 44
and n = 22
```

PROGRAM 23 :- FOR C FUNCTION (USING CALL BY REFERENCE):

```
 1  #include<stdio.h>
 2  // function prototype, also called function declaration
 3  void swap(int *a, int *b);
 4
 5  int main()
 6  {
 7      int m = 22, n = 44;
 8      //  calling swap function by reference
 9      printf("values before swap m = %d \n and n = %d",m,n);
```

```
10     swap(&m, &n);
11 }
12
13 void swap(int *a, int *b)
14 {
15     int tmp;
16     tmp = *a;
17     *a = *b;
18     *b = tmp;
19     printf("\n values after swap a = %d \nand b = %d", *a, *b);
20 }
```

OUTPUT:

```
values before swap m = 22
and n = 44
values after swap a = 44
and b = 22
```

PROGRAM 24 :- FOR POINTERS IN C:

```
#include <stdio.h>
int main()
{
  int *ptr, q;
  q = 50;
  /* address of q is assigned to ptr */
  ptr = &q;
  /* display q's value using ptr variable */
  printf("%d", *ptr);
  return 0;
}
```

Exercise

Program 1:- C program to check odd or even using modulus operator

```
#include<stdio.h>
main()
{
int n;
printf("Enter an
integer\n");
scanf("%d",&n);
if ( n%2 == 0 )
printf("Even\n"
```

```
);
else
printf("Odd\n"
);
return 0;
}
```

Program 2:- C program to perform addition, subtraction, multiplication and division

```
#include <stdio.h>
int main()
{
int first, second, add, subtract,
multiply; float divide;
printf("Enter two integers\n");
scanf("%d%d", &first, &second);
add = first + second;
subtract = first - second;
multiply = first * second;
divide = first / (float)second; //typecasting
printf("Sum = %d\n",add);
printf("Difference = %d\n",subtract);
printf("Multiplication = %d\n",multiply);
printf("Division = %.2f\n",divide);
return 0;
}
```

Program 3:- Insertion sort in c

```
#include <stdio.h>
int main(){
int n, array[1000], c, d, t;
printf("Enter number of
elements\n"); scanf("%d", &n);
printf("Enter %d integers\n", n);
for (c = 0; c < n; c++) {
scanf("%d", &array[c]);
}
for (c = 1 ; c <= n - 1; c++)
{ d = c;
while ( d > 0 && array[d] < array[d-1])
{ t = array[d];
array[d] = array[d-1];
array[d-1] = t;
d--;
}
}
printf("Sorted list in ascending order:\n");
```

```
for (c = 0; c <= n - 1; c++)
{ printf("%d\n", array[c]);
}
return 0;
}
```

Program 4:- C program to add two matrix

```
#include <stdio.h>
main()
{
int m, n, c, d, first[10][10], second[10][10], sum[10][10];
printf("Enter the number of rows and columns of
matrix "); scanf("%d%d", &m, &n);
printf("Enter the elements of first matrix\n");
for ( c = 0 ; c < m ;
c++ ) for ( d = 0 ; d
< n ; d++ )
scanf("%d", &first[c][d]);
